

# Coordinatool

A copytool to rule them all

Big thanks to CEA for organizing LAD and funding this development and talk

(And also to everyone involved in the lustre community for making this possible)

## 1 Introduction

- What?
- Why?

## 2 Internals

## 3 Evolutions

## 4 Demo!

# What?

Introduction

Internals

Evolutions

Demo!

- A lustre copytool. . .
- . . . that acts as a userspace coordinator. . .
- . . . and gives work to real, existing copytools through LD\_PRELOAD overloading

## Two main components:

- Lustre copytool “server”:
  - accept requests from lustre
  - schedules requests to coordinatool clients
- LD\_PRELOAD client library
  - overloads llapi HSM calls
  - allows using existing copytools as coordinatool clients
- administrative client
  - query status, lock states, requeue lost requests. . .

Still WIP (young “free time” project), but already works

# Why?

Introduction

Internals

Evolutions

Demo!

- Reaching the limits of in-kernel coordinator
  - Set limits for each request type per agent
    - CEA agents allow more remove than the rest:  
lustre keeps banging its head on EAGAINS
  - Better request scheduling, retries. . .
- Stepping stone for the real userspace coordinator work (LU-13384)

## 1 Introduction

## 2 Internals

- Lustre copytool “server”
- Client protocol
- LD\_PRELOAD client
- coordinatool\_client
- Tricky bits

## 3 Evolutions

## 4 Demo!

# Server code flow

Introduction  
○○○

Internals  
●○○○○○○○○○○○○○○○○

Evolutions  
○○

Demo!  
○○

## Single thread process:

- register llapi copytool
- bind/listen/accept TCP connections from clients
- epoll loop on `llapi_hsm_copytool_get_fd/clients`
  - Receive & process HSM requests
  - Reply to client requests
  - Hopefully won't block. . .

# Server in depth

Introduction

○○○

Internals

○●○○○○○○○○○○○○○○○○

Evolutions

○○

Demo!

○○

- What do we use to queue actions ?
  - performance bottleneck with catalogs on real coordinator
  - ... might as well use it for recovery: work in memory

# Quick reminder of lustre types: HAI

Introduction

Internals  
○○○●○○○○○○○○○○○○○○○○

Evolutions  
○○

Demo!  
○○

```
struct hsm_action_item {
    __u32      hai_len;      /* valid size of this struct */
    __u32      hai_action; /* hsm_copytool_action */
    struct lu_fid hai_fid; /* Lustre FID to operate on */
    struct lu_fid hai_dfid; /* fid used for data access */
    struct hsm_extent hai_extent;

                                /* byte range to operate on */
    __u64      hai_cookie; /* action cookie */
    __u64      hai_gid;    /* grouplock id */
    char       hai_data[0]; /* variable length */
} __attribute__((packed));
```

# Quick reminder of lustre types: HAL

Introduction  
○○○○

Internals  
○○○○●○○○○○○○○○○○○○○

Evolutions  
○○

Demo!  
○○

```
struct hsm_action_list {
    __u32 hal_version;
    __u32 hal_count;      /* number of hais to follow */
    __u64 hal_compound_id; /* ignored */
    __u64 hal_flags;
    __u32 hal_archive_id; /* which archive backend */
    __u32 padding1;
    char hal_fsname[0];  /* null-terminated */
    /* struct hsm_action_item[hal_count] follows, aligned
       on 8-byte boundaries. See hai_zero */
}
```

# Queueing actions: requirements 1/2

Introduction  
○○○○

Internals  
○○○○●○○○○○○○○○○○○

Evolutions  
○○

Demo!  
○○

- We need to send `hsm_action_lists` to clients
  - queues must group by identical `hal flags/archive_id`
  - for now (v0), single queue only checking identity on append
  - code is structured to allow multiple queues:
    - `hsm_action_queues_get(internal_state, archive_id, flags, fsname)`

# Queueing actions: requirements 2/2

Introduction  
○○○○

Internals  
○○○○○○●○○○○○○○○○○○○

Evolutions  
○○

Demo!  
○○

- We need to quickly find a request by cookie if required
  - for `HSMA_CANCEL` (TODO)
    - easy if not sent yet to a client
    - find which client if there is one
  - deduplication for recovery mechanism

# Queueing actions: implementation

Introduction  
○○○○

Internals  
○○○○○○●○○○○○○○○○○

Evolutions  
○○

Demo!  
○○

- liburcu's double-linked list for queues
  - One queue for each action type (restore, archive, remove)
  - if sent, list head reused for in a list per client
- libc's hashtable for lookup by cookie
  - also one per archive\_id/flags...
- each action in memory also contains:
  - pointer to current client handling it if any
  - pointer to queues (archive\_id/flags, requeue)
  - a copy of the `struct hsm_action_item`

# Client protocol

Introduction

○○○

Internals

○○○○○○○●○○○○○○○○

Evolutions

○○

Demo!

○○

- simple json serialization
- server only replies to clients
  - possibly not right away (e.g. no work to distribute)
- code is shared as much as possible
  - both clients and server
  - a new client would only need to implement a few callbacks

# Commands:

Introduction  
○○○

Internals  
○○○○○○○○●○○○○○○○○

Evolutions  
○○

Demo!  
○○

- STATUS: query server info
  - pending, running and processed action counts
  - number of clients connected. . .
- RECV: request work.
  - Specify how many restore/archive/remove the client can process.
- DONE: report to the server that an action was processed
- QUEUE: push an `hsm_action_list` (more later)

# LD\_PRELOAD client

Introduction

○○○○

Internals

○○○○○○○○○○●○○○○○○○○

Evolutions

○○

Demo!

○○

- Overload llapi hsm functions

# LD\_PRELOAD client: overridden functions 1/2

Introduction  
○○○○

Internals  
○○○○○○○○○○○●○○○○○○○

Evolutions  
○○

Demo!  
○○

- `llapi_hsm_copytool_register`:
  - **connect to server, open lustre root and `.lustre/fid`**
  - **alloc `hsm_copytool_private` with non-lustre MAGIC**
- `llapi_hsm_copytool_unregister`: **cleanup**
- `llapi_hsm_copytool_recv`: **send RECV and wait**

# LD\_PRELOAD client: overridden functions 2/2

Introduction  
○○○○

Internals  
○○○○○○○○○○○○○○●○○○○○○

Evolutions  
○○

Demo!  
○○

- `llapi_hsm_action_begin`
  - call real `llapi_hsm_action_begin`
  - extend `copyaction_private` with some fields
- `llapi_hsm_action_end`
  - call real `llapi_hsm_action_end`
  - send DONE
- `llapi_hsm_copytool_get_fd`
  - just return TCP fd (TODO)

That's it!

# LD\_PRELOAD client: why it works

Introduction  
○○○○

Internals  
○○○○○○○○○○○○○○●○○○○○

Evolutions  
○○

Demo!  
○○

- calling `real llapi_hsm_action_begin` works on different client
  - Lustre does not care if a client different from the one which received request processes it
  - Don't need to do it on `coordinatool/send` temporary file fid...
- similarly, `progress` and other calls mostly work
- borderline bug: `llapi_hsm_action_begin` does not check `copytool_private MAGIC`
  - need `mnt_fd` and `open_by_fid_fd` at correct offset

- Intended for administrative tasks (stats...)
- Or debugging/tests
  - Request work and dump it on stdout
  - No done: server requeues work on client disconnect
- Very simple and unpolished (~250 lines of code)
- Mostly just reuse common init and protocol code

# Tricky bits

Introduction  
○○○○

Internals  
○○○○○○○○○○○○○○○○●○○○

Evolutions  
○○

Demo!  
○○

- Server restarting
- Client disconnecting
- Lustre tunings

# Server restarting

Introduction

○○○○

Internals

○○○○○○○○○○○○○○○○●○○

Evolutions

○○

Demo!

○○

- Action queue only in memory
- lustre doesn't handle a copytool disappearing really well
  - actions that had been sent are never resent
- `mdt.fsnam-MDT0xyz.hsm.active_requests` to the rescue
  - Parse the file and send it with “queue”
- Last problem: actions currently being handled by clients
  - (TODO) client writes in filesystem on `action_begin`
  - read files on startup, give related actions a grace period

# Client disconnecting

Introduction

○○○

Internals

○○○○○○○○○○○○○○○○○○●○

Evolutions

○○

Demo!

○○

- currently requeues its processing actions immediately
- (TODO) give a grace period to reconnect ?
  - reclaim running actions on connect
  - trust service manager to not have duplicate on same host
  - later.

# Lustre tunings

Introduction  
○○○○

Internals  
○○○○○○○○○○○○○○○○○○○○●

Evolutions  
○○

Demo!  
○○

- don't let requests expire
- send requests to coordinatool ASAP

```
lctl set_param -P  
mdt.lustre0-MDT*.hsm.active_request_timeout=31days  
mdt.lustre0-MDT*.hsm.loop_period=1  
mdt.lustre0-MDT*.hsm.max_requests=1000
```

■ What next?

4 Demo!

# What next?

Introduction  
○○○○

Internals  
○○○○○○○○○○○○○○○○○○○○

Evolutions  
○●

Demo!  
○○

- Finish TODOs listed earlier
  - server restart and HSMA\_CANCEL
- Waa-ay more tests
- Improve scheduling:
  - Got basic restore > rest like coordinator
  - Check file owners and don't let a user hog all agents
  - group requests by locality on tape?
- More commands? dump requests, lock/unlock. . .
- Lustre userspace coordinator API support
- The sky's the limit!
